

**FINAL REPORT  
OF  
THE PROJECT ENTITLED**

**“DOCUMENTATION OF MANGROVES AND MANGROVE  
ASSOCIATES FROM MUMBAI”**

**SUBMITTED TO  
MANGROVE FOUNDATION, MUMBAI**

**JANUARY 2018 – APRIL 2018**

**SUBMITTED BY:**

**DR. SUCHANDRA DUTTA, M.SC., PH.D., FIAAT  
ASSISTANT PROFESSOR, DEPARTMENT OF BOTANY,  
R. D. & S. H. NATIONAL COLLEGE, BANDRA (W.), MUMBAI 400050**

### **Scientific Documentation Team Members:**

- Dr. Suchandra Dutta (PI)
- Mr. Kiran Chakral
- Mr. Hensal Rodrigues
- Mr. Farhan Suraliwala
- Ms. Aaliya Shaikh

### **Photographs by:**

- Dr. Suchandra Dutta
- Mr. Kiran Chakral
- Mr. Hensal Rodrigues

### **Volunteers for population study of *Avicennia marina* from Mumbai:**

- SYBSc Botany Students, R. D. & S. H. National College, Bandra (W.), Mumbai

### **Activities conducted :**

- **Visits to suburbs of Mumbai** (Almost once every fortnight on an average) Metropolitan region to document mangroves, mangrove associates and other species (Gorai, charkop, Bhayender, Marve, Manori, Dahisar, Bandra, Esselworld, Naigaon, Vasai, Virar, Bhandup, Airoli, Vikhroli, Nerul, Elephanta islands (January 2018-November 2018) and **collection of mangrove and mangrove associate species** for the purpose of herbarium
- **Visit to places around Mumbai , i. e., Raigad, Ratnagiri and Sindhudurg** (Vengurla, Kille Nivti, Malvan, Tarkarli, Terekholand Panjim) to collect other mangrove species for the purpose of herbarium (with prior permission from funding authority).
- **Scientific study of specimens** to identify them (in the laboratory) based on their **morphological characters** using simple microscope. Only in very doubtful case, anatomical study was performed.
- **Herbarium consultation** at Central National Herbarium, Kolkata; Blatter Herbarium, Mumbai to understand the correct identity of the plants

- Reference to **relevant research papers and original protologue and type specimens** to ascertain the correct identity and **confirm the new taxa**
- Making of **herbarium voucher**

#### Project Outcome:

- **13 species of Mangroves** from Mumbai
- **37 species of Mangrove associates**
- **260 species of plants** belonging to **231 genera and 92 families** from Gorai, Charkop, Bhayender, Marve, Manori, Dahisar, Ghod Bunder, Bandra, Esselworld, Naigaon, Vasai, Panju Island, Virar, Bhandup, Airoli, Vikhroli, Nerul, Elephanta islands (January 2018 - April 2018)
- **1 new subsp., 1 new forma**
- **1 new record for the state of Maharashtra**
- **Documentation of 1 mangrove species which is otherwise very rare** in Mumbai

## **Introduction:**

**MANGROVES – The Life Line of Coastal Cities & A home to many species of Birds and other invertebrates.** Apart from housing a variety of insects, molluscs, crustaceans and reptiles, it also harbors a plethora of birds; both aquatic and tree-dwelling. Some of the commonly found birds here are *Kingfishers*, *Herons*, *Storks*, *Sea Eagles*, *Kites*, *Sand Pipers*, *Bitterns*, *Egrets*, *Cormorants*, *Black winged stilts*, etc. This is because many birds depend on the mangroves for their prey (*Sea Eagles*, *Kites*, *Pond Herons*, *Egrets*, etc) while many thrive on the mangroves since it provides a perfect breeding environment (the likes of *Cormorants* and *Egrets*). They serve as **breeding ground** for many of the crustacean and other species of animals. These organisms are in turn **food** for many of the birds. They need to be protected to save this ecosystem. Moreover, mangrove belt helps in **checking the inlands from flood**.

There are around **13 species of mangroves** and **37 mangrove associates** reported from **Mumbai**. The dominant species of mangroves are *Avicennia marina* var. *acutissima*, *Avicennia marina* var. *acutissima forma pumila* (*forma nov.*), *Sonneratia apetala*, *Avicennia alba*, *Agiceras corniculata*, *Bruguiera cylindrica*. *Lumnitzera racemosa*, a very rare mangrove in Mumbai is reported from Gorai and Charkop.

With **the urbanization**, mangrove land is becoming the **target for the land developers**. They deposit construction wastes near the sea which **adversely affect not only the sea and mangroves, it directly affect the livelihood of local Koli people** (ref.- personal communication)

During the present survey in Bandra (W.), we have noticed that the tree species such as *Peltophorum pterocarpum*, *Ficus bengalensis*, *Ficus religiosa*, etc. have proceeded inside the mangrove vegetation. This itself is an indicator of the changing ecosystem of this place.

*Sonneratia alba*, a mangrove species which was not earlier reported from Bandra, is recorded now.

Gorai, Borivli (West) has a rich mangrove vegetation. It is the type location for *Avicennia marina* var. *acutissima* and also for our new taxa *Cistanche tubulosa* sub sp. *palustris*. Near Tarzan Lake, Charkop, Kandivli (West) is the type locality of our new taxa *Avicennia marina* var. *acutissima forma palustris*.

Gorai, Dahisar, Lokhandwala mangrove area are being affected by sewage discharge which directly pollute the habitat. It has an adverse effect on the mangrove vegetation. Local people are encroaching the mangrove land for construction activity. Same situation is reported from Mira Road (West). Local encroachers do not allow any outsider to even pass through the area.

**Mangrove tourism** is established in the eastern suburb of Mumbai by the authority. Whereas, in western suburb and New Mumbai no formal mangrove tourism is there. Some of the areas where mangrove tourism can be developed are Bandra (West), Gorai (on the way to Pagoda), Mira road (where people are not allowed by the locals), Virar (West). There are three biodiversity rich lakes situated in Nerul, Charkop (Tarzan lake) and Lokhandwala lake around mangrove vegetation. Many species of migratory birds are flocking in these lakes, some of these species are rare. **Rough**, one of the very rare species of bird is reported very recently (during bird race organized by R. D. & S. H. National College) from Lokhandwala Lake. Nature lovers have been regularly visiting these areas for bird watching.

Local villagers can be trained in the area of scientific aspects of mangroves and its associated flora and fauna. They may serve as the tour guide. This might sensitise the local people towards the protection of the vegetation, create oneness with their own surrounding thereby checking encroachment for other illegal purpose. A mangrove information centre should be established in the western suburb also. This effort might help to protect these mangrove rich locations by people's participation.

**Enumeration of Mangroves, Mangrove Associates and other species (Invasive & Cultivated) from Gorai, Bhayender, Marve, Manori, Dahisar, Ghod bunder, Bandra, Esselworld, Naigaon, Panju Island, Vasai, Virar, Bhandup, Airoli, Vikhroli, Nerul, Elephanta islands (January 2018 - April 2018)**

Sr.	Botanical name		Family	Habit
1	<i>Abelmoschus esculentus</i>	Moench.	Malvaceae	Shrub
2	<i>Abrus precatorius</i>	L.	Fabaceae	Climbing
3	<i>Abutilon indicum</i>	Sweet	Malvaceae	Shrub
4	<i>Acacia nilotica</i>	(L.) Delile	Mimosaceae	Tree

25. Fruits with soft thorny projections.....	<i>Pergularia daemia</i>
25. Fruits without any thorny projections.....	26
26. Flowers greenish yellow in many flowered umbel, leaves larger, non succulent, Fruits woody.....	<i>Watakakka volubilis</i>
26. Flowers cream yellow, inflorescence few flowered, leaves smaller, fleshy,	

fruits non woody.....	<i>Pentatropis capensis</i>
24. Plant without latex.....	27
27. Stem mostly quadrangular, calyx persistent, cover the fruits.....	<i>Operculina turpethum</i>
27. Stem not quadrangular, calyx not persistent.....	28
28. Stem with prominent lenticels, ripe fruits red.....	<i>Tinospora cordifolia</i>
28. Lenticels not so prominent on stem, flowers conspicuous.....	29
29. Corolla tube long, white.....	<i>Ipomoea tuba</i>
29. Corolla tube short, other than white.....	<i>Ipomoea littoralis</i>
20. Leaves pinnately compound.....	30
30. Pods covered with bristles.....	31
31. Inflorescence drooping, flowers dark purple colored.....	<i>Mucuna pruriens</i>
31. Inflorescence erect, flowers light bluish .....	<i>Pueraria tuberosa</i>
30. Pods not covered with bristles.....	32
32. Leaves sweetish to taste, seeds red with black eye.....	<i>Abrus precatorius</i>
32. Leaves not sweetish to taste, seeds other than red.....	33
33. Legume elongated.....	<i>Derris scandens</i>
33. Legume broad, ovate.....	<i>Derris trifoliata</i>

## **Discussion on the identity of some of the mangroves and mangrove associates from Mumbai:**

### **Identity of *Avicennia* in Mumbai & discovery of one new taxa:**

As per earlier record, there are **four species of *Avicennia***, (namely *A. alba*, *A. marina*, *A. marina var. acutissima* & *A. officinalis*) **found along Mumbai coast**. There are many views (of different taxonomists) regarding the identification of *Avicennia* sp. **For the purpose of the current project, I have followed the treatment opted by N. C. Duke (1991).**

The **differentiating characters** among these three species of *Avicennia* are:

- **The leaf shape:** Lanceolate – ovate in *A. alba*, Ovate – elliptic- lanceolate in *A. marina*, Ovate – lanceolate – elliptic in *A. marina* var. *acutissima*
- **The leaf apex** is acute in *A. marina*, acute-acuminate in *A. alba* & *A. marina* var. *acutissima* and rotund in *A. officinalis*
- **Inflorescence** capitate in *A. marina*, *A. marina* var. *acutissima* and *A. officinalis* whereas it is spicate in *A. alba*.
- **Fruit** compressed, oval in *A. marina*, ellipsoid elongated in *A. alba* and compressed, elongate , ellipsoid in *A. officinalis*.

The most commonly found *Avicennia* in Mumbai has ovate – lanceolate leaves with acute as well as acuminate leaf apex. The fruit is beaked, slightly elongated. **The old stem has presence of resinous secretion . and it is greenish when dampened with sea water. This species is identified as *A. marina* var. *acutissima***

- *Commonly found Avicennia marina* var. *acutissima* is mixed with *A. marina*
- ***Avicennia alba* is not reported from Mumbai** and its surroundings
- *Avicennia officinalis* is found more towards Bhayender, Vasai, Naigaon, Diva- Mumbra area.

**Another common strands of *Avicennia* found towards the sea which is commonly known as dwarf *Avicennia*.** As per ICN every plant must have one and only one name. However, ‘dwarf *Avicennia*’ is not a botanical name. Hence, we chose to study this plant in detail and decide its correct botanical identity. This dwarf variety closely resembles *A. marina* var. *acutissima*.

**The distinguishing characters of this dwarf *Avicennia* are:**

1. Plants **dwarf tree**. Branched. Bark **grey colored** (the bark in *A. marina* var. *acutissima* is greenish when wet)
2. Pneumatophores cylindrical , upto 30 cm in height (above ground)

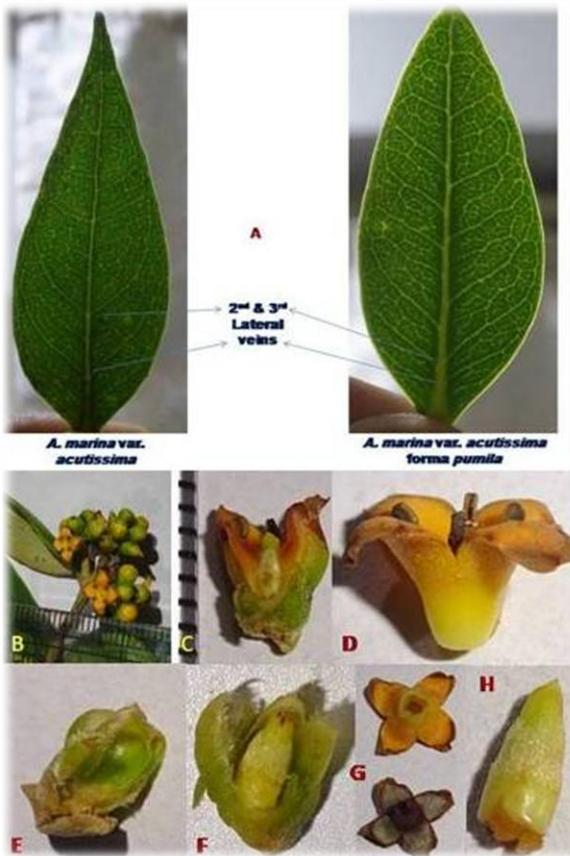

3. Leaves opposite, petiole 0.3 cm, **ovate – elliptic, length : breadth ratio 2:1, apex shortly acute – slightly acuminate, base attenuate** as against elliptic leaf with acute – acuminate apex & length : breadth ratio 3:2 – 2:1 in *A. marina* var. *acutissima*;
4. **2<sup>nd</sup> and 3<sup>rd</sup> lateral veins arranged alternately** as against opposite in *A. marina* var. *acutissima*.
5. Inflorescence **condensed capitate**. About **7 flowers per inflorescence** as against 11 flowers in *A. marina* var *acutissima*. The **lateral peduncle compressed** as against that of *A. marina* var. *acutissima* where it is elongated.
6. Calyx, corolla hairy outside and glabrous inside. Corolla yellow initially, turning orangish at maturity. Sweetly scented.
7. Ovary conical, hairy at the middle. Stigma 2 lobed.
8. The anatomical structure of the dwarf *Avicinnia* resembles that of *A. marina* var. *acutissima* in its structure of salt gland and inverted T shaped hair.

***Avicennia marina* (Forsk.) Vierh. var. *acutissima* Stapf ex  
Moldenke forma *pumila* (*forma nov.*)**

The key to identify the *Avicennia marina* from its variety and forma is as follows:

1. Leaf apex acute, Trees tall.....*Avicennia marina*
1. Leaf apex acute – acuminate; Trees tall, medium sized or dwarf.....2
  2. Tall or medium sized tree, 2<sup>nd</sup> & 3<sup>rd</sup> lateral veins opposite to each other .....*A. marina* var. *acuminata*
  2. Dwarf tree; 2<sup>nd</sup> & 3<sup>rd</sup> lateral veins alternate .....*A. marina* var. *acuminata* forma *pumila*

*Avicennia marina* (Forssk.) Vierh. var. *acutissima* Staph. & *Moldenke forma pumila* (forma nov.)  
Characteristic features & Holotype

**A – Arrangement of lateral veins, B- Inflorescence, C- L. S. of flower, D- position of anther,  
E – Hairy ness of calyx & Bract, F- Carpel, G- Fresh & Dry flower, H- Hair on ovary**

We identify this dwarf *Avicennia* as *Avicennia marina* (Forssk.) Vierh. var. *acutissima* Staph. & *Moldenke forma pumila* (forma nov.), Family: Avicinniaceae. **Holotype: SD/FS 002**, collected from Tarzan Lake, Charkop, Kandivli (W.), Mumbai, Maharashtra, India and deposited at Blatter Herbarium (BLAT). The isotypes are deposited at the herbarium of R. D. & S. H. National College (RDNCP) .

**Phenology:** Flowering begins from Mid April and extends up to end of May to beginning of June (varies in different locations); fruiting begins from July and extends up to September.

**Etymology:** the forma ‘*pumila*’ (meaning dwarf) is named after the habit of the plant.

#### Identity of *Acanthus ilicifolius* L. (Acanthaceae) found in Mumbai:

The genus *Acanthus* is described by C. Linnaeus in his Genera Plantarum in 1754. In his Species Plantarum (1753) Linnaeus named 4 species, two of them belonging to Europe while the other two, namely *Acanthus ilicifolius* and *A. maderaspatensis* are from India.

Jussieu (Genera Plantarum, 1789) )named the genus *Dilivaria* (But, he did not definitely make any new species, such as, *D. ilicifolia* in this publication. Thus *D. ilicifolius* (L.) Juss is invalid and illegitimate name, though this name has been used by various taxonomists).

Later on, in 1806 Persoon describes *D. ilicifolia* under the genus *Dilivaria* thereby definitely including this species under *Dilivaria*. Thus, the accepted name of this species is ***D. ilicifolia* (L.) Persoon** Synopsis Plantarum 2. 1806

*Acanthus ilicifolius* L. is characterised by the presence of terminal inflorescence. The plants collected by us from Mumbai shows terminal as well as axillary inflorescence.

Molecular treatment of new world and old world plant reveals that *Acanthus* and *Dilivaria* are two different group. Taxonomists have treated the mangrove genus from India under the genus *Dilivaria* Juss.

According to our observation, the commonly known *Acanthus ilicifolius* L. from Bombay coast should be **corrected as *D. ilicifolia* (L.) Persoon (Basionym- *A. ilicifolius* L.)** Type : *Acanthus ilicifolius* L. (LINN 816.6) deposited at Linnaean herbarium.

### **Identity of *Clerodendrum inerme* L.**

A very common mangrove associate *Clerodendron inerme* L. found in almost all locations in our study area. In one of our trips we came across a specimen which shows very thick leaf with axillary flower (which is not a very common occurrence). In the same plant we observes axillary cyme infloresce. This observation made me incusitive about the identity of this plant.

Upon literature survey, we came across the genus *Volkameria*. **The differentiating characters of these two plants are :**

1. Terminal inflorescence in *Clerodendrum* vs. axillary and terminal inflorescence in *Volkameria*
2. Persistent, green Calyx cup at the base of the ovary/ Fruit in *Volkameria* vs. Expanded colourful calyx in *Clerodendrum*
3. Green fruit turning brownish in *Volkameria* vs Bright colored fruits in *Clerodendrum*.

The identity of the plant in question is corrected as *Volkameria inermis*.

**Record of *Lumnitzera racemosa*** from Gorai and Charkop – a rare mangrove species in Mumbai. However, this species is commonly found in Ratnagiri and Sindhudurg district, Maharashtra. This species was reported from Thane coast (Untawale 1994).

**New record for the state of Maharashtra :** *Thespisia populneoides* is reported as new record for the state of Maharashtra from Dahisar (Bhakti complex). It is noted that this species is common in other locations such as Gorai, Charkop, In Vikhroli (Godrej campus), it is planted along with *Thespisia populnea*.

**Identity of *Cistanche tubulosa* (Schenk.) Hook.f.:** *Cistanche tubulosa* (Schenk.) Hook f. is a holoparasite plant growing in desert area. It connects to the root of the host plant (*Salvadora persica*, *Tamarix gallica*, etc.). Its associated flora: *Salvadora persica*, *Avicennia marina* var. *accutissima*, *Avicennia officinalis*, *Asparagus* sp., *Odina wodifer*, *Tinopsora cordifolia*, *Brugeria* sp., *Thespisia populnea*, *Cadabba fruticosa*...etc, growing on saline marshy soil. It can tolerate saline habitat. In Mumbai it is found in Gorai Creek, Borivli (W.) and Charkop .

**The distinguishing characters of this plant are :** The flowers show dominance of **bilobed, trilobed and tetra-lobed condition, 5-lobed condition is occasionally observed.** A single plant can show 2-3 types of stigmas. **Anthers are non-apiculate obtuse and completely attached to the connective** as compared to the typical subspecies ‘tubulosa’ which shows cordate-sagittate type of anthers. **The species is represented by ca. 800 individuals** growing along either side of the roadway, about 2-3km in stretch. Another population at Charkop , Kandivli shows a distinct increase in corolla tube length, i.e., 4.7 cm. long.

**We establish a new subspecies and named this plant as *Cistanche tubulosa* (Schenk.) Hook. f. sub sp. *palustris* (sub species nov.)**

**Phenology:** Flowering begins from December to February and extends up to March and April; fruiting begins from January and extends up to April.

**Etymology:** the subspecies ‘*palustris*’ is named after the habitat of the plant on which it grows as a parasite (Halophytic habitat)

#### **Key to Subspecies:**

Habitat usually sandy, scales alternate and remotely arranged, anthers cordate- sagittate, obtuse, stigma bilobed and placentae four..... *C. tubulosa* subsp. *tubulosa*

Habitat saline, scales spiral or whorled closely arranged, anthers obtuse, stigma 1-5 lobed and placenta equaling no. of stigma lobes.....***C. tubulosa* subsp. *palustris***

**Type:** SD/HR/KC 180216, collected from Gorai Creek (about 1 km from Jetty), Borivli (W.), Mumbai, Maharashtra, India , deposited at Blatter Herbarium (BLAT). The isotypes are deposited at the herbarium of R. D. & S. H. National College (RDNCP) .

***Cistanche tubulosa* (Schenk.) Hook. f. sub sp. *palustris* (*sub species nov.*)**- Characteristic feature and Holotype

**Identity of Suaeda:** Earlier botanists have recorded *Suaeda marittima* as well as *S. nodiflora* from the saline habitat under mangrove projects. However, we could not find these two species of *Suaeda* during our study. But, recorded *Suaeda fruticosa* from Naigaon, Vasai areas. This species shows **3 stigma, and the bract is entire.**

**Spreading habit of  
*Suaeda fruticosa* Forsk. Ex Gmel.**

**Male stage (A) and Female  
stage of the flower (B)**

**Identification of three lichen species**, namely, *Graphis* sp., *Lecanora* sp. & *Pyxine* sp. from mangrove habitats in Sindhudurg district. However, in Mumbai we could find *Lecanora* sp. in Charkop and Gorai area only. It gives an indication of its surroundings. For. Eg. *Lecanora* sp. indicates their tolerance to hot, humid and saline air.

**Rhizophora apiculata** is only found under cultivation and Godrej campus, Vikhroli.

**Scaveola taccada and Cerbera manghas** are recorded only under cultivation (in Mumbai) and are not included in the key.

**Mangroves documented from Raigad, Ratnagiri and Sindhudurg :**

*Rhizophora apiculata*, *Lumnitzera racemosa*, *Kandelia candel*, *Cerbera manghas*, *Sonneratia caseolaris* besides *Avicennia marina*, *A. officinalis*, *Sonneratia alba*, *S. apetala*, *Bruguiera cylindrica*, *Salvadora persica*, *Agiceras corniculata*, etc. from various location in Sindhudurg. **Heritoria sp.** – ‘Sundri’ (species exists in Kille Nivti area at Dongobache rahi sacred grove) but couldn’t locate

**Distribution of Mangrove species in the Mumbai** (Gorai, Charkop, Bhayender, Manori, Dahisar, Ghod Bunder, Bandra, Esselworld, Naigaon, Vasai, Panju Island, Virar, Bhandup, Airoli, Vikhroli, Nerul, Elephanta islands (January 2018 - April 2018):

Name	Status in the study area	Locations where sighted
<i>Avicennia marina</i>	Common	All locations
<i>Avicennia marina</i> var. <i>acutissima</i>	Very common	All locations
<i>Avicennia marina</i> var. <i>acutissima forma</i> ....	Very common	All locations
<i>Avicennia officinalis</i>	Common wherever present	All locations except Bandra, Lokhandwala, Charkop, Gorai, Vikhroli, Nerul
<i>Dilivaria ilicifolia</i>	Common wherever present	All locations except Bandra, Lokhandwala,
<i>Rhizophora mucronata</i>	Occasional	Bandra, Malad, Elephanta, Versova
<i>Rhizophora apiculata</i>	Rare	Found only in cultivation
<i>Sonneratia apetala</i>	Common wherever present	All locations
<i>Sonneratia alba</i>	Common wherever present except in Bandra	Elephanta island, Manori, Bandra (only a few plants)
<i>Ceriops tagel</i>	Common wherever present	All locations except Bandra
<i>Brugueira cylindrica</i>	Common wherever present	All locations except Bandra
<i>Lumnitzera racemosa</i>	Rare	Gorai, Charkop
<i>Agiceras corniculatum</i>	Common wherever present	All locations except Bandra

### Future scope:

- **Detailed survey and systematic study** is required to understand the species diversity in mangrove belt in all the districts of Maharashtra.

- Scientific study to **identify plants as invasive species** and how these invasive species are affecting the mangroves. It is necessary to study in detail to delimit the status of mangrove associate and invasive species.

Here for the purpose of this project, we have treated the plants which are found among mangroves as well as in other habitat as mangrove associate. Scientific approach is required to definitely classify the plants as mangrove associates.

There are different views to classify any plants as invasive species. To determine the status of invasive species, more systematic study is required.

- More study is required to **understand if active speciation is taking place** among mangroves, especially for the species like *Rhizophora*
- Detailed study on **pollinator and pollination biology of mangroves**
- **Survey of Lichens , Fungi and Macro and Micro algae** from Mangrove vegetation in Maharashtra

### **Acknowledgement:**

I am grateful to Mangrove Foundation for financial support for the documentation of Mangroves and Mangrove Associates from Mumbai. Thanks are due to Dr. K. N. Gandhi, Senior Nomenclature Registrar, Harvard University Herbarium, USA for his help in the nomenclature study, to Dr. Subir Bandopadhyay, Central National Herbarium, Kolkata; Dr. R. D. Shinde , Director Blatter Herbarium and Mr. Pravin Kale, Blatter Herbarium, St. Xaviers' College, Mumbai for their help in Herbarium study to establish the correct identity of mangrove and mangrove associates.

## Appendix

While identifying the plants it was found that one must have a basic understanding of the basic morphology. Many of the mis identifications of the past is due to the incorrect interpretation of the leaf shapes (especially in Avicennia sp.). Here we followed the descriptions after William Stern (1983) and have appended the guide to the leaf shape along with the plates of the same

### **A guide to the leaf shape (Stern, 1983)**

Name	Definition
<b>Acicular</b>	Needle shaped. linear, rigid, tapering to a fine point from a narrow base.
<b>Subulate</b>	Awl shaped. linear, very narrow, tapering to a very fine point from a broadish base.
<b>Auriculate</b>	Ear lobe shaped; having two small rounded lobes at the base.
<b>Cuneiform</b>	Wedge-shaped: inversely triangular, with rounded angles
<b>Deltoid</b>	a solid, the transverse section of which has a triangular outline, like the Greek A
<b>Linear</b>	<i>many times longer than broad, approximately parallel sides.</i> length: breadth = 6 : 1 to 3 : 1
<b>Ensiformis</b>	Sword-shaped -Long, quite straight, with the point acute.
<b>Lanceolate</b>	Lens- shaped - Long, wider in the middle. length : breadth = 6 : 1 to 3 : 1
<b>Ob-lanceolate</b>	Top wider than bottom
<b>Oblong</b>	length: breadth = 2: 1 to 3 : 2, the sides almost parallel
<b>Ovate</b>	Oval (egg shaped) , broadest at the lower end, so as to resemble the longitudinal section of an egg. length: breadth = 2: 1 to 3 : 2, broadest below the middle
<b>Obovate</b>	opposite of ovate
<b>Elliptic</b>	Oval, with a short point, elliptical, acute at each end. length: breadth 2 : 1 to 3:2 with sides curved equally from middle
<b>Rotund</b>	Somewhat round, a little inclining to be oblong. length: breadth = 6 : 5 , broadest at middle

Name	Definition
<b>Cordate</b>	Heart-shaped. having two round lobes at the base . the whole resembling the heart in a pack of cards
<b>Spathulate</b>	Spoon-shaped. oblong, with the lower end very much attenuated,so that the whole resembles a chemist's spatula.
<b>Sagittate</b>	gradually enlarged at the base into two straight lobes, like the head of an arrow.
<b>Hastate</b>	abruptly enlarged at the base into two acute diverging lobes, like the head of a halberd
<b>Rhomboid</b>	Diamond-shaped. oval, a little angular in the middle
<b>Lobed</b>	With several points
<b>Hastate</b>	Spear shaped - Pointed, with barbs
<b>Pinnatisect</b>	Cut, but not to the midrib
<b>Peltate</b>	Rounded, stem underneath
<b>Perfoliate</b>	Stem through the leaves
